                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a DNA construct (I) comprising a first (FI) and a second (F2) expression cassette. FI of the DNA construct, in operable linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3-phosphate synthase (EPSPS) gene (III), and transcriptional terminator (IV), and F2 has cauliflower mosaic virus 35S promoter, Hsp70 intron, (II), (III) and (IV). Also included are two DNA sequences from corn plant them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell into a fertile corn plant. The present sequence is the 498b amplicon consisting of corn genomic sequence, vector sequences and Rice ACTI promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 498
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel DNA construct useful for producing a corn plant that tolerates application of glyphosate herbicide, comprises two transgene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CF,

The invention relates to a DNA construct (I) comprising a first (F1) and a second (F2) expression cassette. F1 of the DNA construct, in operable linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3 phosphate synthase (EPSPS) gene (III), and transcriptional terminator (II), (III) and (IV). Also included are two DNA sequences from corn plant Pv-ZMGT32(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate tolerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is the 1183bp amplicon consisting of the Agrobacteium transcriptional terminator sequence,
                                                                                                                                                                                                                                                                                                                                                                                                    22-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The patent discloses a method for selectively enhancing the phosphonate CC herbicide tolerance in recombinant corn, tobacco, wheat, cotton, canola CC and rice plants, by transforming the plants with an expression cassette. CI tromprises of a structural DNA sequence, that encodes an aminomethyl CC phosphonic acid (AMPA) acyltransferase or transacylase (AAT), capable of CC transit peptide (CTP), that targets AAT to the chloroplast CC-expression CC of glyphosate oxidase (GOX) gene, encoding glyphosate oxidoreductase, CC phosphonate herbicides the transformed plants with higher resistance to CC phosphonate herbicides the transformed plants with higher resistance to CC phosphonate herbicides. This method is useful for enhancing phosphonate CC and to prevent self-fertilisation and enhance hetero-fertilisation. The CC present DNA sequence is the expression cassette-3, comprising a plant CC perable promoter and 5, sequences like intron, linked to modified B. CC coli phnO coding region, encoding P2A AMPA acyltransferase (AAT) enzyme CC and plant operable termination sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC rice EPSPS promoter, genomic DNA encoding a FROM protein modified such that C transit peptide, genomic DNA encoding a EPSPS chloroplast c it is resistant to glyphosate resistant EPSPS contains a region (AAB29792) and a transcriptional CC terminator. The glyphosate resistant EPSPS contains a region (AAB29793) CC containing two amino acid substitutions relative to the corresponding CC wild-type region (AAB29792). The invention also encompasses plant genomic EPSPS sequences identified via screening with a rice EPSPS intronic CC sequence; vectors and host plant cells comprising a nucleic acid sequence of the invention, optionally further CC comprising a nucleic acid sequence of the invention, optionally further CC comprising a nucleic acid sequence of the invention, optionally further CC comprising a nucleic acid sequence of the invention, optionally further CC constructs of the invention are used to produce a wide variety of CC constructs of the invention are used to produce a wide variety of CC comphologically normal, glyphosate resistant plants. The glyphosate cCC sugarbeet and canola, but also other field crops, fruits and vegetables, C sugarbeet and canola, but also other field crops, fruits and vegetables, C strees, desication and/or other hordicides. The plants are used to insects, fungi, viruses, bacteria, nematodes, C strees, desication and/or other from the high throughput in vitro C cenhancer element which may be used in the rice EPSPS expression cassette contains and contains a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an Oryza sp. 5-enolpyruvylshikimate phosphate synthase (EPSPS) gene. Vectors containing the gene may be used to produce plant tissues and fertile whole plants which are substantially tolerant or substantially resistant to glyphosate herbicide and to produce a herbicidal target which is used for high throughput in vitro screening of potential herbicides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an invention that results in the expression of the endogenous nucleotide sequence in plant cell being increased. In this method the plant cell comprises a second expression cassette comprising a nucleic acid molecule, where the expression of the nucleic acid molecule of interest in the plant cell is decreased as compared to expression of the nucleic acid molecule of interest in a plant cell lacking the first expression cassette. The methods and compositions of the present invention are useful in molecular biology and transformation, in particular for reproducing and predictably manipulating gene expression in a plant cell. The present sequence is a nucleotide sequence of rice actin promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ij
This sequence represents the promoter region from the rice actin-1 (RAc1 gene. Cytoplasmic actin is a fundamental and essential component of the eukaryotic cell and cytoskeleton. In higher plant cells, a number of cellular processes, such as cytoplasmic streaming, extension growth and cell division are thought to involve the cytoskeletal actin protein. All of the studied plant actins consist of four exons of conserved length,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2181 BP; 602 A; 518 C; 430 G; 631 T;

In rice there are at least 8 actin-like sequences per haploid genome. RAc1 encodes a transcript that is relatively abundant in all rice tissues. This sequence is an example of a nucleic acid molecule of the invention. The nucleic acid molecules of the invention contain the RAc1 gene (or fragments) with promoter activity in monocotyledonous plants. The promoter is used to direct

                                                                                                                                                                                                                 screened with a heterologous actin probe. The CDS encodes a 377 amino acid actin protein of 41 9 kD. The gene is interrupted by three introns (position not disclosed). Analysis also revealed an additional intron 5 of the translation initiation region. This 5 intron separates a 79 bp GC rich 5 noncoding exon from the exon coding the translation initiation codon. This is one of few cases of a 5 noncoding exon in a plant gene. The promoter region can be used to confer high level expression of foreign genes in transgenic rice and other agronomically important plants. It is five times more active than the maize Adhl promoter in trans-formed rice. (Updated on 25-MAR-2003 to correct PA field.)

of the studied plant actins consist of four exons of conserved length, separated by 3 introns of variable length. In rice there are at least 8 actin-like sequences per haploid genome. RAC1 encodes a transcript that is relatively abundant in all rice tissues. This sequence is an example of a nucleic acid molecule of the invention. The nucleic acid molecules of the invention contain the RAC1 gene, or fragments with promoter activity (see AAT80052 and AAT80053) in monocotyledonous plants. The promoter is used to direct expression of foreign genes in transgenic rice and other plants. The actin promoter is more efficient in rice transformation than previously proposed promoters (e.g. 5 times more active than the maize Adhl promoter) and has constitutive accivity in space and time. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cellular processes, such as cytoplasmic streaming, extension growth and cell division are thought to involve the cytoskeletal actin protein. All of the studied plant actins consist of four arms of actin protein. All
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a the rice actin-1 (RAc1) gene amplified using AAT80054. Cytoplasmic actin is a fundamental and essential component of the eukaryotic cell and cytoskeleton. In higher plant cells, a number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Col 3-7; 29pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid containing the promoter of the rice actin-l direct efficient expression of foreign genes in rice.

                                                                                                                                                                                                                                  The invention relates to a grass plant, which has been genetically modified to substantially inhibit generative propagation and carry herbicide resistance. The grass is useful for growth and/or propagation of grasses. The grass is used to play at least one sport (e.g. baseball, cricket, football, golf, rugby, soccer or tennis), or used at least in a portion of an athletic field, lawn or park. The grass is fed to animal (e.g. cattle, goat, horse or sheep) or used as an animal feedstuff. The present sequence represents the coding sequence of pVDH636 vector containing the Arabidopsis AtH1 gene, which was used to inhibit flowering

The invention relates to a grass plant which has been genetically comodified to substantially inhibit generative propagation. The genetic comodification may result in a heritable change in one or more plant characteristics such as inhibition of flowering (or substantial delay that amounts to inhibition), absence of inflorescence, increased comodiction of tillers, delayed heading and inhibition of the production of tillers, delayed heading and inhibition of the complemental switch from vegetative to generative growth. A method of complemental switch from vegetative to generative growth. A method of complemental switch from vegetative to generative growth. A method of complemental switch from vegetative to generative growth. A method of complemental switch from vegetative to generative growth. A method of complying a phytohormone to at least partially relieve or reverse a change complementally modified grass is useful for growing and/or propagating grass in athletic fields (for sports such as baseball, cricket, football, golf, crugby, soccer and tennis), lawns, parks and other types of landscaping. Complementally modified grass and animal feedstuff for cattle, goats, horses and sheep, due to its increased vegetative growth, improved digestibility and sheep, due to its increased vegetative growth, improved digestibility landscaping production of transgenic grasses expressing the Arabidopsis thaliana are all the production of transgenic grasses expressing the Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Grass; plant; transgenic; flowering inhibition; inflorescence; gene; ds; tiller production; delayed heading; gibberellic acid; phytohormone; golf; genetically modified grass; athletic field; sport; baseball; cricket; football; rugby; soccer; tennis; lawn; landscaping; cattle; horse; sheep; goat; animal feedstuff; Arabidopsis thaliana; AtHI; homeobox gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18-AUG-2000; 2000US-0226422P.

                                                                                                                                                                                                        introducing into the plant an expression cassette comprising a promoter operably linked to a ferulic acid esterase encoding polynucleotide; and (2) a transgenic plant (II) produced by (MI). The transgenic plants are useful in improving digestibility for livestock and enhancing blomass conversion. The method is useful for enhancing the production of more highly fermentable carbohydrates in plants, especially forage grasses. The expression cassette is useful for controlling the level of phenolic acids in plant cell walls of a transgenic plant. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                The present invention describes a transgenic plant (I) comprising an expression cassette with a promoter operably linked to a ferulic acidestrase encoding polynucleotide. Also described: (1) controlling (Methodology) the level of phenolic acids in plant cell walls of a transgenic plant the level of phenolic acids in plant cell walls of a transgenic plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New transgenic plant comprising an expression cassette with a promoter operably linked to a ferulic acid esterase encoding polynucleotide, useful in improving digestibility for livestock and enhancing biomass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            transgenic plant; ferulic acid es plant; cell wall; improved digest highly fermentable carbohydrate;

                                                                                                                                                                                                                                                               The present invention relates to transgenic plants comprising an expression cassette having a promoter operably linked to a ferulic acid esterase (PAE) encoding polynuclectide. The transgenic plants are useful for enhancing the availability of fermentable carbohydrates as feed for grass-fed animals. The methods are useful for reducing the levels of phenolic acids in the cell walls available for cross-linking either by directly disrupting ester bonds linking phenolics and lighins to cell wall polysaccharides or by preventing excessive ferulation of cell wall polysaccharides or by preventing excessive ferulation of cell wall
                                                                                                                                                                                                                          Sequence 1259 BP; 337 A; 332 C; 268 G; 322 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                               New transgenic plant comprising an expression cassette with a promoter operably linked to ferulic acid esterase encoding polynucleotide, useful for enhancing availability of fermentable carbohydrates as feed for grant for enhancing availability of fermentable carbohydrates.

                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a number of cellular processes, such as cytoplasmic streaming, extension a number of cell division are thought to involve the cytoskeletal actin protein. All of the studied plant actins consist of four exons of conserved length, separated by 3 introns of variable length. In rice there are at least 8 actin-like sequences per haploid genome. RAcI encodes a transcript that is relatively abundant in all rice tissues. This sequence is an example of a mucleic acid molecule of the invention. The nucleic acid molecules of the invention contain the RAcI gene (or fragments) with promoter activity in monocotyledonous plants. The promoter is used to direct expression of foreign genes in transgenic rice and other plants. The actin promoter is more efficient in rice transformation than previously proposed promoters (e.g., 5 times more active than the maize Adhl promoter) and has constitutive activity in space and time. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oryza sativa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Promoter; rice; actin 1 gene; cytoplasm; cytoskeleton; extension growth; cytoplasmic streaming; cell division; RAc1; maize; Adhl promoter; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a fragment from the promoter region of the rice actin-1 (RAc1) gene. Cytoplasmic actin is a fundamental and essential component of the eukaryotic cell and cytoskeleton. In higher plant cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid containing the promoter of the rice actin-1 gene - used to direct efficient expression of foreign genes in rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wu R,

                                                                                                                                                                                                         introducing into the plant an expression cassette comprising a promoter operably linked to a ferulic acid esterase encoding polymucleotide; and (2) a transgenic plant (II) produced by (M1). The transgenic plants are useful in improving digestibility for livestock and enhancing biomass conversion. The method is useful for enhancing the production of more highly fermentable carbohydrates in plants, sepecially forage grasses. The expression cassette is useful for controlling the level of phenolic acids in plant cell walls of a transgenic plant. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New transgenic plant comprising an expression cassette with a properably linked to a ferulic acid esterase encoding polynucleotuseful in improving digestibility for livestock and enhancing be
                                                                                                                                                                                                                                                                                                                                                 The present invention describes a transgenic plant (I) comprising an expression cassette with a promoter operably linked to a ferulic acid esterase encoding polynucleotide. Also described: (1) controlling (MI) the level of phenolic acids in plant cell walls of a transgenic plant

/note="Organ: immature ears; Site 1: Xbā I; Site 2: Xba I;
The vector was digested with XbaI and one nucleotide was
added by fill in in the recessive 3' end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector
(.x/y reads in M13mp19, .b/g reads in DUC19). The same
ligation was transformed in either JM107 or DH5a. "

/note="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
The vector was digested with XbaI and one nucleoTide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size tractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /mol_type="genomic DNA"

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "

/clone="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
/note="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed into DH5a."

/note="Organ: leaf; Vector: RescueMu (engineered from
pBlueScript backbone); Site 1: BamHI; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid P was grown at Molokai in 2002. DNA was
extracted from leaf strips, double digested using BamHI
and BglII, and ligated to form circular plasmids. DH10B
and BglII, and ligated to form circular plasmids.

/note="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
The vector was digested with XbaI and one nucleoTide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleoTide was
added by fill in in the recessive 3' end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector (:x/y
reads in M13mp19, .b/g reads in pUC19). The same ligation
was transformed into DH5a."

/note="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
The vector was digested with XbaI and one nucleotide was
added by fill in in the recessive 3' end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector
(.x/y reads in M13mp19, .b/g reads in pUC19). The same
ligation was transformed in either JM107 or DH5a. "
